

# Science meet Management

## The Baltic Sea Action Plan against Eutrophication

Fredrik Wulff

# The HELCOM Challenge

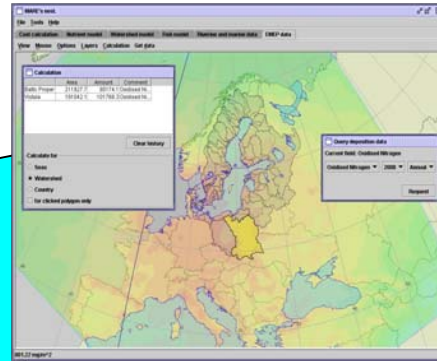

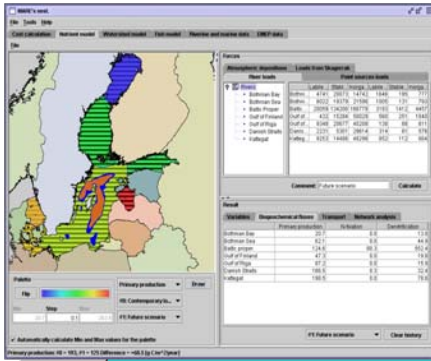

- For the *entire* Baltic Sea
- How much should nutrient loads be reduced to reach a good environment?
- How to allocate nutrient reductions between countries?

# What is Baltic Nest?

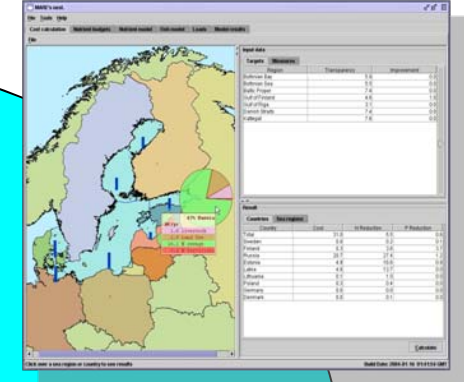

- A model tool for describing Baltic Sea ecosystem dynamics
- A method to link scientific information to management decisions
- A unique decision support system for marine management

# Atmospheric emissions and load

## Marine modeling

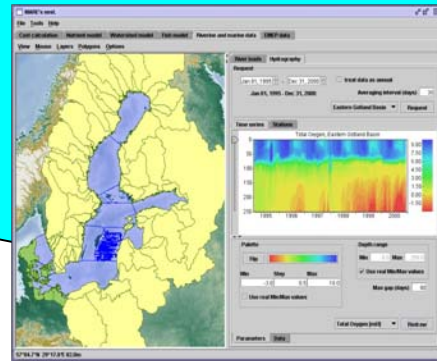

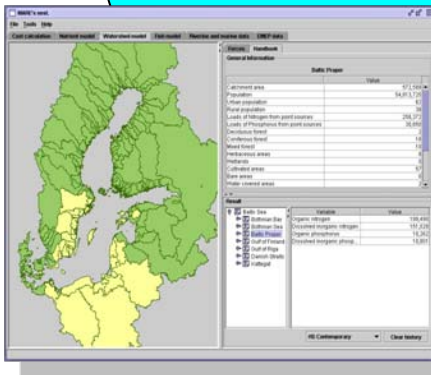

## Cost minimization model

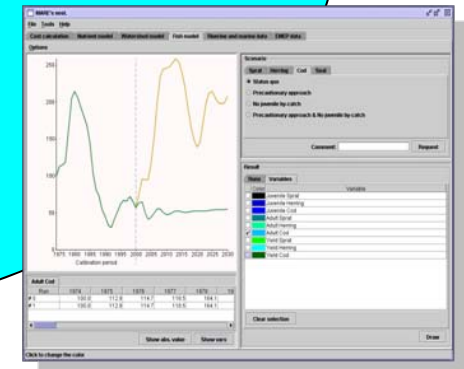

*NEST can be used freely with any computer with Internet access from <http://nest.su.se/nest/>*

## Drainage basin modeling

## Marine and runoff data

## Fishery management

# BSAP: The three basic steps

1. Define allowable inputs
2. Estimate what will be done by excising legislations
3. Allocate the rest

# Good Environmental conditions – set by HELCOM (EUTRO PRO)

Gulf of Finland Water transparency

For most regions  
this means  
conditions  
comparable to  
those in the 1950-  
1960ties

**Table 1. Loads of total nitrogen and phosphorus (tons year<sup>-1</sup>) to the Baltic Sea sub-basins (riverine and coastal point sources), averaged for 1997-2003 (from official data reported to HELCOM) and the reductions needed to reach the environmental targets as well as maximum allowable inputs.**

# The country allocation scheme

# Step 2: Reductions imposed by improved waste water treatment

- The wastewater treatment levels, as required by EU (91/27/EEG) set nitrogen reduction to 70%-80% and phosphorus reduction to 80% for cities above 10,000 inhabitants and are comparable to the HELCOM requirements.
- For cities between 10,000 and 2,000 inhabitants we are assuming secondary treatment levels, i.e. 35% for nitrogen and 35% for phosphorus.
- Effluents from populations that live in rural areas were treated as manure
- Information on MWWTP connection for 2004

Table 7. Additional nutrient load reductions (tons yr<sup>-1</sup>) needed to reach the environmental target of each basin when improved WWT has been implemented.

# Step 3 Allocation

- The remaining needed total load reductions to each basin are calculated with the % share for each country of the remaining total loads to the particular basin.

# Country allocations

| Country   | Phosphorus | Nitrogen |
|-----------|------------|----------|
| Germany   | 242        | 5,621    |
| Denmark   | 16         | 17,207   |
| Estonia   | 222        | 896      |
| Finland   | 146        | 1,199    |
| Lithuania | 881        | 11,746   |
| Latvia    | 300        | 2,561    |
| Russia    | 2,500      | 6,967    |
| Poland    | 8,755      | 62,395   |
| Sweden    | 291        | 20,780   |
| Common    | 1,662      | 3,779    |
| Total     | 15,014     | 133,152  |

# BSAP current state

- Significant load reduction have already been achieved during the last years (not detected for 1992-2003)
- The total loads to be reduced will thus be less

# TIMETABLE FOR THE BSAP REVISION

BEFORE THE 2013 MINISTERIAL MEETING

|      |   |   |   |
|------|---|---|---|
| 2010 | Re-evaluation of environmental targets                | Update of models<br>Ensemble modeling                 | Update of data  |
| 2011 | Environmental targets ready                           | Recalculation of maximum allowable inputs             | Revised country allocation schemes                        |
| 2012 | Scientist and managers agree on environmental targets | scientist and managers agree on environmental targets | scientist and managers agree on country allocation scheme |
| 2013 | HELCOM MINISTERIAL MEETING                            |   |   |

# Other options

- Reduce atmospheric depositions (now 25% of current N load)
- Inputs from North Sea
- Shipping
- Nutrient trading
- ‘Ecological engineering’
- Fishery management

# Science can help to

- Define operational environmental targets
- Show what is needed to reach such specific environmental targets
- Describe the relative importance of various factors influencing pollution
- Define how much can you improve the environment – by whom
- Describe what are minimum cost/ or cost alternatives to reach a specific target

# Science can **not** define

- What is a good Baltic sea?
- How much is it worth - What is good enough?
- How long can we wait?
- Which measures are political and socially acceptable
- How to implement measures

**Thank You**
